

BloodSight AI

Predict. Prepare. Prevent Shortages.

BloodSight AI is an AI-powered demand forecasting platform designed for blood banks and healthcare organizations. It analyzes historical blood usage, current inventory, donor appointments, seasonal patterns, holidays, local events, and other relevant factors to predict future blood demand and identify potential shortages before they happen.

Instead of reacting when blood supplies become critically low, blood organizations can use BloodSight AI to plan targeted donor campaigns in advance.

How it works

BloodSight AI connects to a blood organization's existing data and provides:

SPECIFIC REQUIREMENTS:

For hospitals and organizations:

Demand forecasting — Predict blood requirements by blood type and location.

- Machine Learning Analysis — Our models analyze historical donation rates and transfusion requests to identify patterns.
- Trend Tracking — The system spots seasonal dips, such as reduced donations during holidays or summer months.
- Demand Forecasting — Usage is projected based on hospital admission data and local trauma event patterns.
- Match possible donors from the data base to be contacted.
- ✦ External Risk Factors
 - Weather and Disaster Monitoring — Severe weather alerts flag risk of canceled community blood drives. ex Earthquakes in Japan
 - Public Health Data Integration — Local outbreak and seasonal illness data feeds into projected medical needs.
 - Global Supply Chain Tracking — Centralized data sources help track broader blood supply chain trends.

Inventory and Supply Monitoring

- Daily Stock Audits — The platform tracks shelf-life expiration dates and current unit counts in real time.
- Stock Threshold Alerts — Automated notifications trigger when supply levels drop below safe operational minimums.
- Shared Network Visibility — Regional inventory data is cross-referenced across connected hospitals for shared supply awareness → **Link between other hospitals and clinics network**

Shortage alerts — Identify when inventory is likely to fall below a safe threshold.

Campaign recommendations — Suggest when and where donor recruitment campaigns should be launched.

Seasonal forecasting — Account for periods such as holidays, summer vacations and other recurring patterns.

Appointment forecasting — Compare expected donations with projected demand.

What-if scenarios — Model situations such as increased hospital demand or reduced donor participation. Estimate how an additional 50, 100 or 200 donations could affect projected inventory.

Management dashboard — Give blood-bank managers a clear view of current inventory and future risk.

FOR PATIENTS

- they got notified if there is an emergency need for blood donations in case of a disaster or accident
- they can see which hospital in their area needs amount of blood
- there is a tracker of how much blood they donated and a feature as a reward system that shows how many patients they have saved
- you can see where you can donate
- you can get an appointment
- you can see how often you donated
- specific bloodtype
- and you can contact specific blood bank about details

Example

BloodSight AI detects that O-negative demand is expected to increase over the next two weeks while scheduled donations are below the projected requirement.

The platform alerts the blood bank:

Potential shortage: O-negative

Estimated risk period: October 8–15

Projected gap: 180 units

It then recommends launching an O-negative donor campaign in the affected region before the shortage develops.

Target customers

National blood services

Regional blood banks

Hospital blood banks

Healthcare networks

Emergency medical organizations

Business model

BloodSight AI could operate as a B2B SaaS platform, charging organizations a recurring subscription based on factors such as the number of facilities, regions, or volume of data processed.

Core value proposition

"Don't wait for a blood shortage. Predict it."

BloodSight AI turns blood-bank data into early warnings and actionable planning decisions, helping organizations maintain adequate supplies while reducing unnecessary emergency recruitment campaigns.
